MEZO BUILDATHON · WAVE 1 · TRACK 2

AI agents pay for data in MUSD.

AgentFeed is a live crypto-data API for agents. This is its new rail: one signed permit, no account, no API key, no gas.

```
mezo.ochinimus.app
```

PROBLEM

Agents are customers that banks and APIs can't serve.

- An agent can't open an account, pass KYC or keep a monthly subscription.
- It holds a wallet, not an API key, and often no gas token on the chain it pays on.
- Stablecoin payments for agents exist, but most are built for USDC and EIP-3009. **MUSD, Bitcoin-backed and on Mezo, has none of that plumbing.**
- So the Bitcoin economy's own dollar is not yet something an agent can spend.

WHAT IT DOES

One HTTP call. One signature. Paid in MUSD.

```
$ curl -i mezo.ochinimus.app/api/liquidations
HTTP/2 402 Payment Required
payment-required: { asset: MUSD 0x1189…c503,
  network: eip155:31611, amount: 0.02 MUSD,
  payTo: treasury, nonce: …, expires: 300 s }

# agent signs an EIP-2612 permit, retries with it
HTTP/2 200   data + explorer link to the settlement
```

- 8 routes at 1 to 5 cents: prices, liquidations, funding, market snapshot, trade context, summarize.
- Client script and an MCP server: `list_routes`, `call_route`.

LIVE NUMBERS · READ FROM THE GATEWAY'S LEDGER

Real payments on Mezo testnet. Not mocks.

67
paid calls settled

1.26
MUSD to the treasury

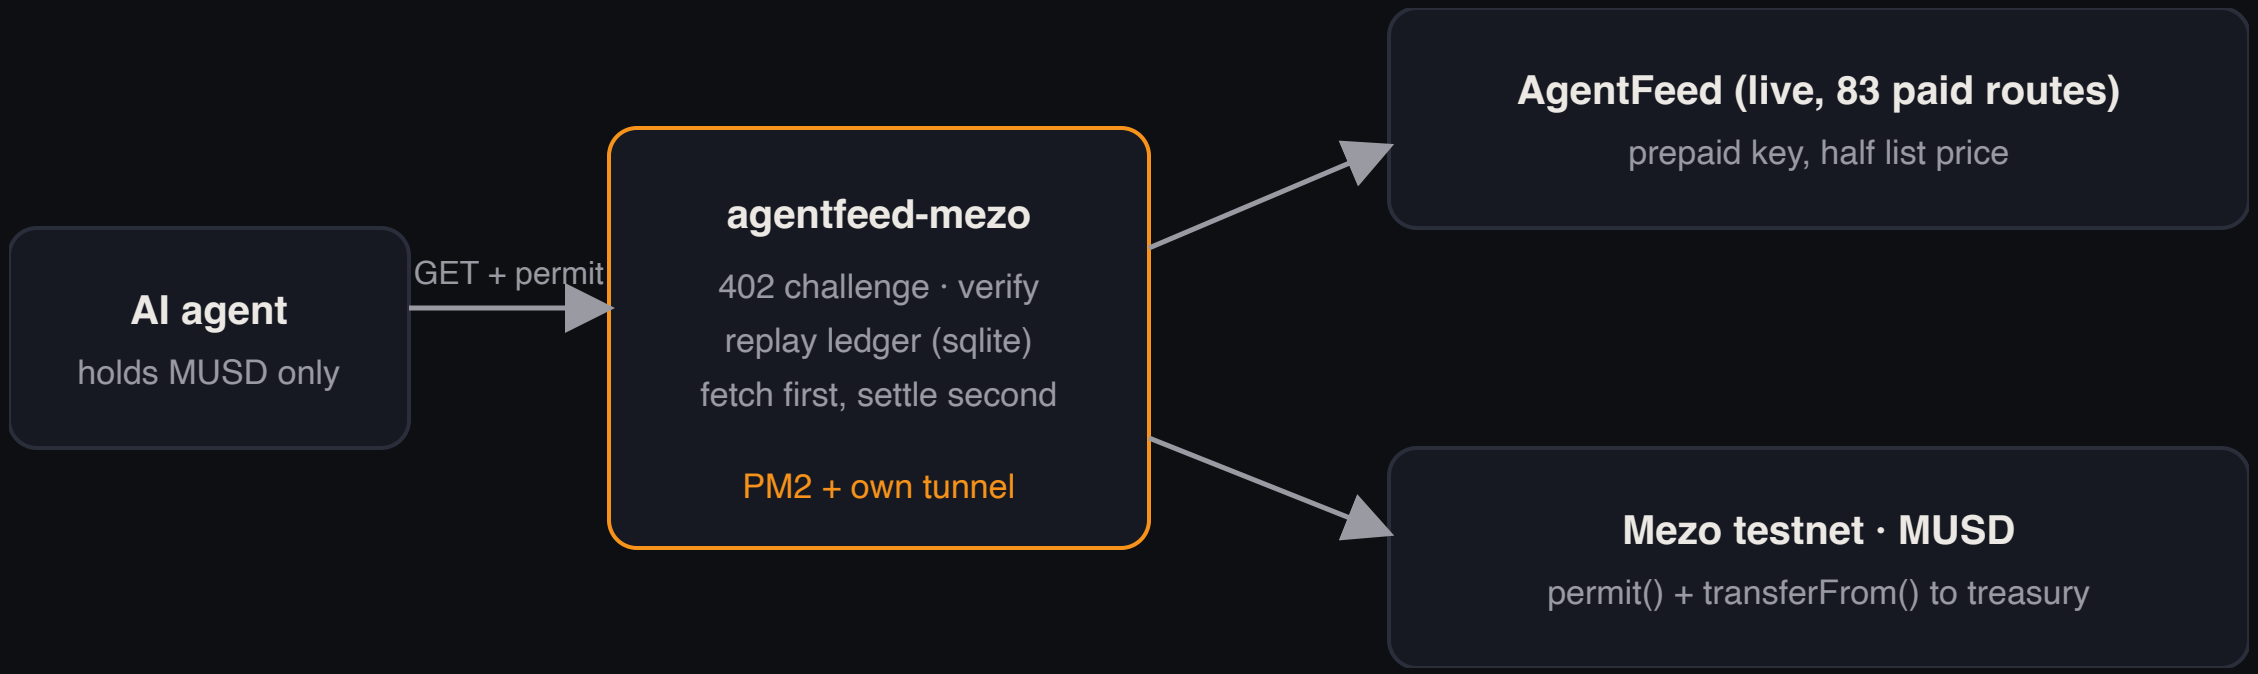

8
routes live, 2 schemes

- Every call is a MUSD transfer on explorer.test.mezo.org: a `transferFrom` with its `permit` beside it (58 calls), or a plain transfer (9).
- Ledger is public: `/payments.csv`. Every row re-read from the chain by `verify-evidence.mjs`: 67 of 67.
- Median 7.8 s per permit call end to end (56 calls timed by the client, p90 15 s), set by Mezo's 4 s blocks.

ARCHITECTURE

A separate gateway. Production AgentFeed untouched.

gateway pays the gas · the agent signs once · upstream outage = payer not charged

WHY MUSD

Built to fit the token as deployed.

checked on-chain	result
MUSD testnet `0x1189…c503`	"Mezo USD", 18 decimals
EIP-2612 `permit`, `nonces`	present
EIP-3009 `transferWithAuthorization`	absent, so x402 "exact" is not possible
MUSD also deployed on Base mainnet	answers at `0xdD46…F186`

- Permit gives the same one-signature UX on MUSD: agent needs no gas.
- Depth: signature checked against MUSD's live domain and nonce, `permit()` simulated before spending gas, MUSD minted via Mezo Borrow.

WAVE 2 · NOV 2 TO 15

From a rail to a distribution surface.

- **Mezo mainnet MUSD:** same code, mainnet config, a per-call gas surcharge.
- **MUSD on Base:** agents that live on Base pay without bridging.
- **Telegram bot:** a person tops up a MUSD budget, sets caps, the bot signs permits for their agents. Agents never hold a key.
- **Spend allowance:** one permit, many calls, so agents can call in parallel.

Why we keep going: AgentFeed already has paying agents. MUSD is one more way for them to pay.

TRY IT

Five minutes, no wallet to start.

- `curl -i mezo.ochinimus.app/api/sol-price`
- mezo.ochinimus.app/stats and /payments.csv, then any explorer link
- github.com/seekdaseek/agentfeed-mezo · README · CHECKLIST · `npm test`

MUSD is where Bitcoin meets agents.
